

# Splunk SIEM Lab & Threat Detection Analysis

## Project Overview

This project demonstrates the setup and configuration of a Security Information and Event Management (SIEM) system using Splunk. The objective was to ingest, monitor, and analyze Windows and Sysmon logs to gain visibility into endpoint activity and support security detection capabilities.

## Screenshots

### 1. Splunk login or dashboard homepage

**Purpose:** Confirms successful deployment and accessibility of the SIEM platform

### 2. Selecting data input method (Monitor)

**Purpose:** Shows how data ingestion is initiated in Splunk

### 3. Selecting local Windows event logs for ingestion

**Purpose:** Demonstrates selection of Windows log source

#### 4. Configured Windows Event Logs for ingestion

**Purpose:** Shows configuration of log sources for monitoring

#### 5. Reviewing configured Windows Event Logs before submission (5A)

**Purpose:** Shows validation of correct configuration prior to ingestion

## 5. Successfully configured Windows Event Log ingestion in Splunk (5B)

**Purpose:** Confirms successful deployment of log ingestion pipeline

## 6A. Configured Sysmon log ingestion for advanced endpoint monitoring

**Purpose:** Demonstrates collection of advanced endpoint telemetry including process creation, command-line activity, and system behavior using Sysmon

## 6B. Sysmon operational logs successfully generated in Event Viewer

**Purpose:** Confirms endpoint telemetry is active prior to SIEM ingestion

## 7. Sysmon logs successfully ingested and analyzed in Splunk

**Purpose:** Demonstrates real-time visibility into endpoint activity and the ability to detect process execution using SIEM analytics

## Conclusion

Successfully configured a SIEM environment capable of ingesting and analyzing Windows and Sysmon logs. This project demonstrates foundational SOC analyst skills including log ingestion, endpoint monitoring, troubleshooting, and basic detection capability. This project simulates real-world SOC workflows including log ingestion, monitoring, troubleshooting, and basic detection analysis.

## Troubleshooting & Problem Solving

- Resolved Splunk Web ingestion issues (404 errors) through troubleshooting and service validation
- Implemented manual log ingestion using inputs.conf when UI-based configuration failed
- Diagnosed and resolved Splunk service restart and permission-related issues
- Validated data ingestion pipeline using SPL queries (index=\*, index=\* sysmon)
- Simulated endpoint activity to confirm log generation and ingestion accuracy

## Threat Simulation & Detection Analysis

Simulated endpoint activity by executing various system and administrative commands (e.g., whoami, ipconfig, netstat, and PowerShell commands).

Leveraged Splunk SIEM to analyze Sysmon logs and identify process creation events (Event ID 1). Used SPL queries to filter and detect command-line activity and investigate event details, including process execution, command-line arguments, and parent-child relationships

## 1. Simulated endpoint activity through command-line execution

**Purpose:** Demonstrates generation of system and administrative activity for detection testing

Executed commands including:

- whoami
- ipconfig /all
- netstat -ano
- PowerShell (Get-Process, Get-Service)

```
Administrator: Command Prompt - powershell
C:\Windows\system32>whoami
desktop-dvksnk0\labuser

C:\Windows\system32>net user

User accounts for \\DESKTOP-DVKSNK0

-----
Administrator          DefaultAccount          Guest
labuser                 WDAGUtilityAccount
The command completed successfully.

C:\Windows\system32>ipconfig /all

Windows IP Configuration

Host Name . . . . . : DESKTOP-DVKSNK0
Primary Dns Suffix . . . . . :
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No

Ethernet adapter Ethernet:

Connection-specific DNS Suffix . :
Description . . . . . : Intel(R) PRO/1000 MT Desktop Adapter
Physical Address. . . . . : 08-00-27-E9-75-51
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . : Yes
Link-local IPv6 Address . . . . . : fe80::8c61:984c:4314:f190%6(Preferred)
Autoconfiguration IPv4 Address. . : 169.254.9.65(Preferred)
Subnet Mask . . . . . : 255.255.0.0
Default Gateway . . . . . :
```

## 2. Detection of command-line and process execution activity using Sysmon logs in Splunk

**Purpose:** Demonstrates ability to detect and analyze process creation events (Sysmon Event ID 1) using SPL queries within a SIEM platform

### 3. Detailed event analysis showing process execution and command-line arguments

**Purpose:** Demonstrates ability to investigate security events by analyzing key fields such as Image, CommandLine, User, and ParentImage

**This analysis demonstrates the ability to simulate suspicious activity and detect it using SIEM tools, replicating real-world SOC analyst workflows.**
